Unmet Medical Needs with Conventional Hemodialysis

In the 1980s the standard of care was low-flux hemodialysis...

- ❖ **Significant intradialytic morbidity** (i.e. symptomatic hypotensive episodes, cramps, and nausea)
- ❖ **High incidence of dialysis related disease** (i.e. β 2M-amyloidosis, atherosclerosis, cardiac disease, and aging)
- ❖ **Poor long-term outcomes** (i.e., mortality and poor quality of life)

Classification of Uremic Toxins

Rosner CJASN 2021

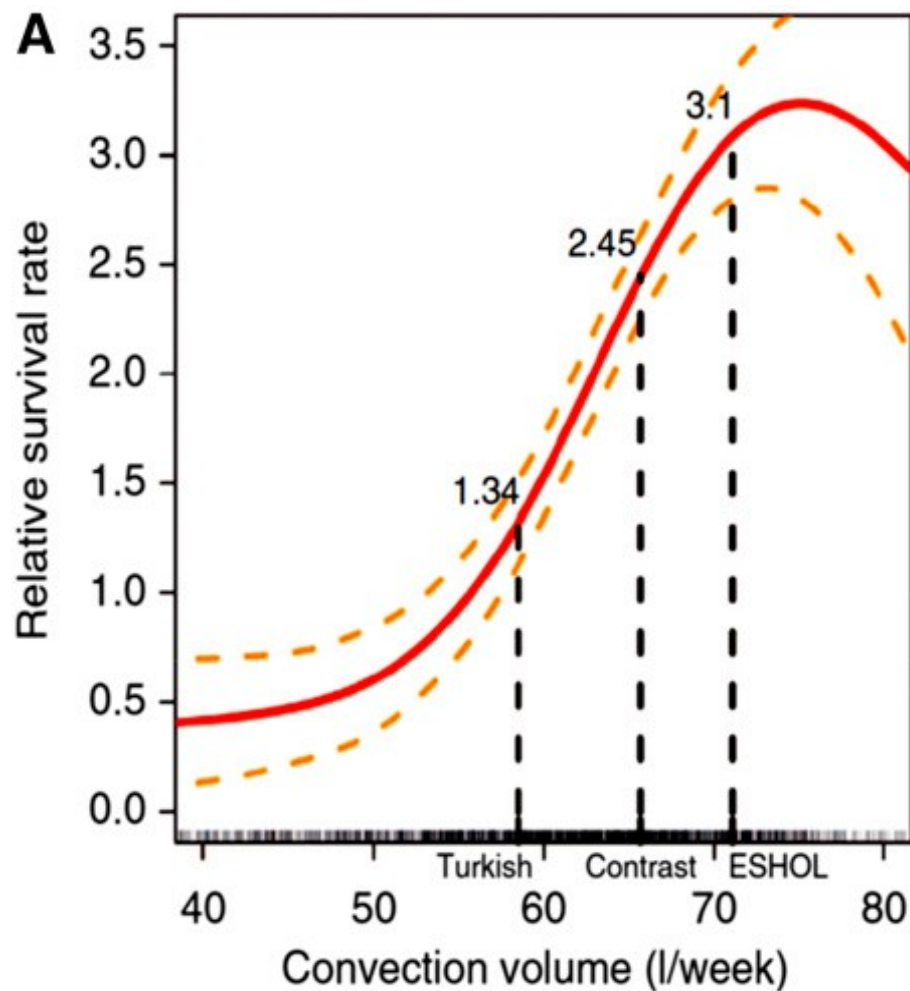

Clinical Benefits of Online HDF

- ❖ **Superior removal capacity** per unit time of online HDF across a large MWt spectrum
- ❖ **Greater hemodynamic stability and improved dialysis tolerance** (removal of negative inotropic compounds, or vasodilating substances, negative thermal balance)
- ❖ **Reduction in chronic subclinical inflammation** Sensitive biomarkers of inflammation (CRP, IL1, IL6, and TNF- α) are significantly reduced with online HDF
- ❖ **Cost-efficiency of online HDF production.** Large volumes of substitution fluid can be produced and adjusted to individual patient needs at the cost of ultrapure dialysis fluid
- ❖ **Long-term clinical outcomes** suggest that relative risk of all-cause and cardiovascular mortality is reduced in patients achieving high-volume online HDF.

Patient Survival Depends on High Convection Volume

Filtration Fraction (FF)

$$FF = \frac{Q_{uf}}{Q_b}$$

FILTRATION FRACTION: do not exceed 30% !!!

$$FF = \frac{Q_{uf}}{Q_b}$$

FILTRATION FRACTION: do not exceed 30% !!!

$$FF = \frac{Q_{uf}}{Q_b}$$

Post-dilution HDF

Pre-dilution HDF

Mixed-dilution HDF

Pre-dilution HDF

By infusing the substitution fluid upstream of the dialyzer, the problems caused by the substantial intradialyzer increase in blood and plasma viscosity are avoided. However, the concentration of uremic toxins in the blood compartment of the dialyzer is reduced by the predilution. This reduces the concentration gradients which drive diffusion and reduces concentrations in the ultrafiltrate, thus reducing clearance by convection. Therefore, in order to provide equivalent clearance to postdilution HDF, predilution substitution and ultrafiltration rates must be much higher

Differences in Convection Volume between Predilution HDF and Mixed-HDF

Variable	Treatment	Observed data				p-value	
		Mean value during 6 mo	Baseline	Month 3	Month 6	Between-group	Within-group
Convection volume (L/session)							
Absolute	Predilution	41.0 ± 10.3	40.4 ± 8.0	39.1 ± 8.7	44.0 ± 13.1	<0.001	0.17
	Mixed	35.0 ± 5.7	32.6 ± 7.8	36.3 ± 4.2	36.1 ± 3.7		0.01
Convection volumes adjusted for body surface area (L/m ² per session)							
Absolute	Predilution	24.5 ± 3.8	24.4 ± 5.1	23.1 ± 5.5	25.8 ± 7.8	0.004	0.27
	Mixed	20.6 ± 5.5	18.0 ± 5.1	20.0 ± 4.1	23.8 ± 10.5		0.004

Ultrafiltration Coefficient (K_{uf})

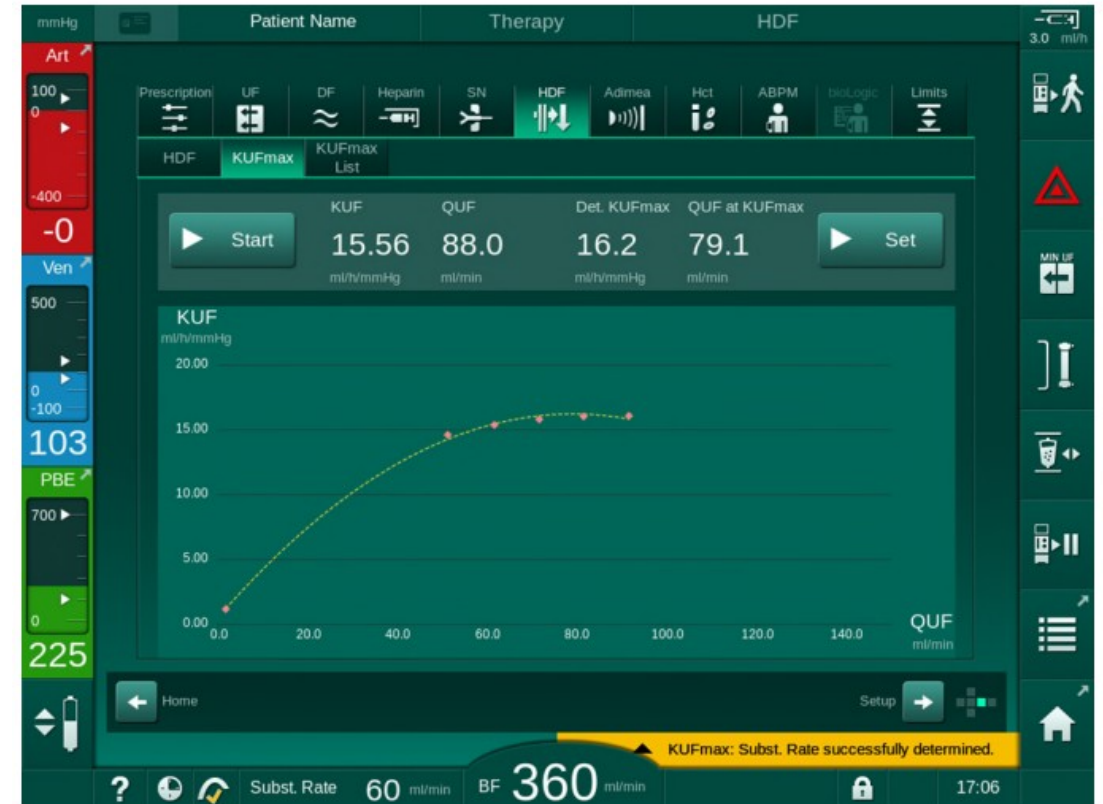

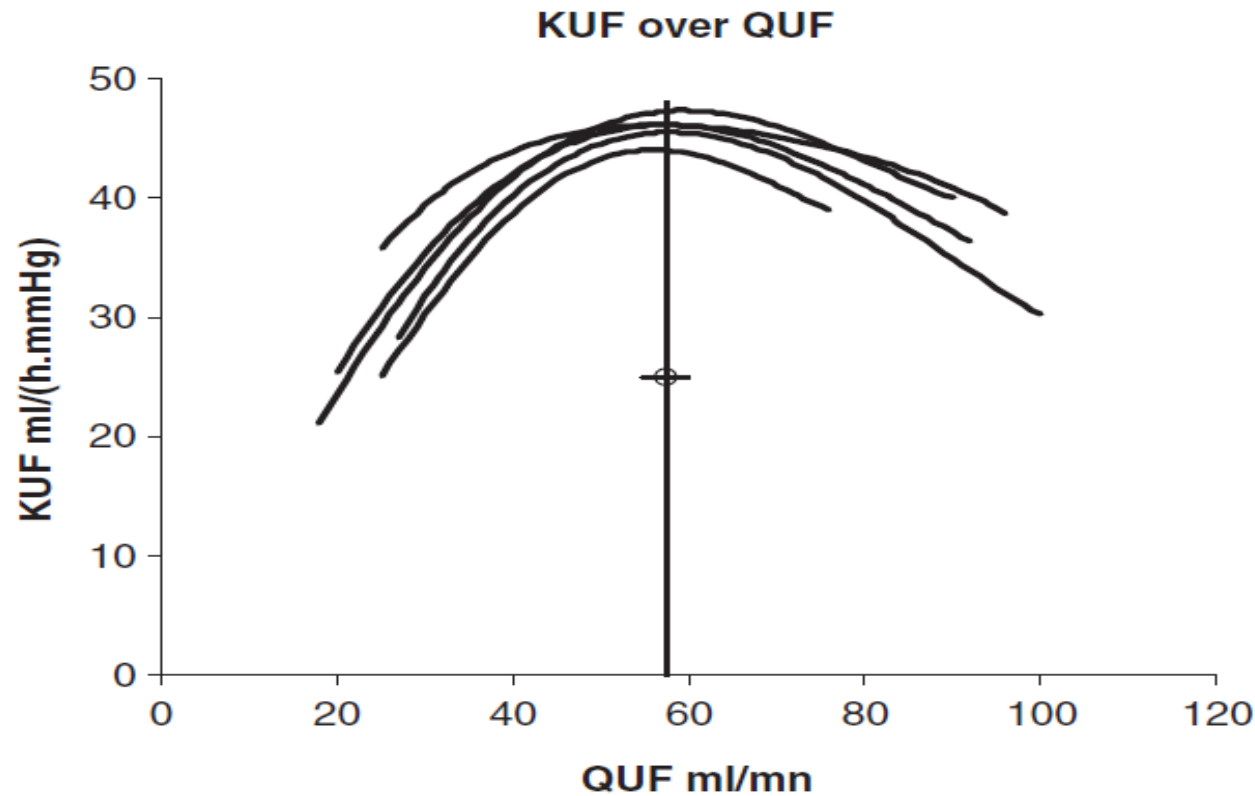

$$Q_{uf} = K_{uf} * TMP$$

The datasheet provided by manufacturers for every dialyzer includes the ultrafiltration coefficient (K_{uf}). This is the ratio Q_{uf}/TMP measured in vitro. Typically, manufacturers determine K_{uf} using bovine or human blood. The required Hct and plasma protein concentration of the blood is standardized at 0.32 ± 0.02 and 60 ± 5 g/L (according to ISO 8637-1).

The Ultrafiltration Coefficient (K_{uf}) of a dialyser is not a fixed value

The Ultrafiltration Coefficient (K_{uf}) of a dialyser is not a fixed value

UTILIZZO DI K_{UF} MAX AUTOMATICO IN «HDF OL POST»

- Buoni volumi di convezione
- Riduzione dell'intervento dell'infermiere per esempio a causa di allarmi di TMP
- Alta Efficienza nella rimozione delle medie molecole (β_2m) con contenimento delle perdite di albumina

Conclusioni

- ✓ L'utilizzo sempre più diffuso dell'emodiafiltrazione on line ha il significato di ampliare il più possibile lo spettro depurativo e si propone l'ambizioso obiettivo di migliorare quantità e qualità di vita del paziente emodializzato
- ✓ L'efficienza di un trattamento convettivo si «misura» in termini di volume di convezione ottenuto. La condizione imprescindibile per ottenere dei volumi di convezione elevati è quella di avere un flusso sangue elevato (FF; TMP; K_{uf})
- ✓ Lo sviluppo tecnologico ha cercato di offrire soluzioni per ottimizzare la depurazione delle «tossine uremiche» medio ed elevato peso molecolare anche nel paziente con accesso vascolare non performante regolando gli scambi convettivi attraverso sistemi di biofeedback oppure realizzando membrane sempre più capaci di sfruttare la cosiddetta «filtrazione interna»
- ✓ La sfida sembra essere dunque quella di utilizzare le conoscenze cliniche e tecnologiche per personalizzare e ottimizzare la terapia dialitica a partire dalle caratteristiche uniche del paziente e, in questo caso, del suo accesso vascolare.
